

Validation Checklist: Common Errors

1. The (app) Folder Structure

Ensure your root directory contains exactly these files/folders. No more, no less:

- codebase.zip
- tests.zip
- Dockerfile
- parsing.py
- run.sh

2. The Golden Rule of ZIP Files

The way you compress these files is critical. Follow these specific methods:

File	Internal Structure (When opened)	How to Zip It
tests.zip	Should contain the tests folder first.	Zip the folder itself.
codebase.zip	Should contain the contents only (no parent folder).	Zip the files inside the folder.

⚠ Warning: Do not make codebase.zip nested (e.g., codebase.zip → codebase/ → files). It must be codebase.zip → files.

3. File Integrity & Cursor Management

While using Cursor, you must be extremely careful with its "Auto-edit" or Agent features.

run.sh and parsing.py

- Action: Monitor these files closely.

- Constraint: Do not allow any changes to the sections labeled "DO NOT MODIFY."

verification.sh

- Action: You are permitted to edit one section only: your Path.

```
# Nothing from the test suite is ever placed into /app.
# /app contains ONLY the agent's codebase & never the tests.
# =====
# -- Where everything lives on the host -----
APP_DIR="/home/abhisek007/mattocock_code/task1_nabid_review_copy/app"
# -- Input files (must all exist in APP_DIR) -----
DOCKERFILE="${APP_DIR}/Dockerfile"
TESTS_ZIP="${APP_DIR}/tests.zip"
CODEBASE_ZIP="${APP_DIR}/codebase.zip"
RUN_SCRIPT="${APP_DIR}/run.sh"
PARSE_SCRIPT="${APP_DIR}/parsing.py"
# -- Docker image tag -----
IMAGE_TAG="agent-evaluator:latest"
# -- Zip nesting guard -----
# Error out if ALL files in a zip are buried deeper than this many levels.
# e.g. 3 allows: file.py, dir/file.py, dir/sub/file.py -- but not deeper.
MAX_ZIP_DEPTH=3
```

- Constraint: Do not update anything else. Ensure your Cursor agent does not "hallucinate" improvements or changes to other lines in this file.
